Create a class called Account that implements the following:

- use docblocks in a similar way to the demo provided, to document the class **/3**
- create two protected properties ($*acctNum, and $*balance). **/2**
- Create a constructor that accepts an account number and starting balance as parameters, and use these values to set the protected properties indicated above **/3**
- create public functions for setAccountNumber(), getAccountNumber(), getAccountBalance(), withdraw() and deposit **/5**
- create an Index.php page where you can create an instance of the Account class, and use it to test the functionality implemented as explained above. **/2**
